The reconfiguration of the private communication systems over IP for wiretapping is ludicrous. The cost and logistics of such a scheme are impractical. You will simply drive many ISP's and more local providers (i.e. IT specialist at business) to resort to encryption and anonymous standards such as i2p and Tarzan. I hope you reconsider such measures as the fallout of implementation will be more severe than the U.S. economy needs right now and the entities in support of such measures (FBI, DEA, NSA, etc.) desire. These plans are a threat to U.S. security not an improvement.
